Issue C

ABP2 SERIES

Board Mount Pressure Sensors

High Accuracy, Compensated/Amplified ±6 mbar to ±12 bar | ±600 Pa to ±1.2 MPa | ±2 inH₂O to ±175 psi Digital Output, Liquid Media Capable

DESCRIPTION

The ABP2 Series are piezoresistive silicon pressure sensors offering a digital output for reading pressure over the specified full scale pressure span and temperature range. They are calibrated and temperature compensated for sensor offset, sensitivity, temperature effects and accuracy errors (which include non-linearity, repeatability and hysteresis) using an on-board Application Specific Integrated Circuit (ASIC). Calibrated output values for pressure and temperature are updated at approximately 200 Hz. All products are designed and manufactured according to ISO 9001 standards. The liquid media option includes an additional gel coating to protect the electronics under port P1, which enables use with non-corrosive liquids (e.g. water and saline) and in applications where condensation can occur. The ABP2 Series is available in tube packaging. Pocket tape and reel packaging is available upon request.

VALUE TO CUSTOMERS

- Simplifies design-in: Small size saves room on the PC board (PCB), simplifying design in smaller and lower power devices. Meets IPC/JEDEC J-STD-020E Moisture Sensitivity Level 1 requirements:
 - Allows avoidance of thermal and mechanical damage during solder reflow attachment and/or repair that lesser rated sensors may incur.
 - Allows for unlimited shelf life when stored at <30°C/85 %RH (simplifying storage and reducing scrap).
 - Eliminates lengthy bakes prior to reflow.
 - Allows for lean manufacturing due to stability and usability shortly after reflow.
- Cost-effective: Small size helps engineers reduce design and manufacturing costs while maintaining enhanced performance and reliability of the systems they design.
- Accurate: Total Error Band (TEB) and wide pressure range enable engineers to optimize system performance by improving resolution and system accuracy.

- Flexible: Supply voltage range, variety of pressure units, types and ranges, output options, and wide operating temperature range simplify use in the application
- Versatile: Wet-media compatibility, low power, and temperature output options make the sensor a versatile choice for Internet of Things applications

DIFFERENTIATION

- Application-specific design ensures suitability for a wide array of customer requirements.
- Digital output allows the sensor to be directly plugged into the customer's circuitry without requiring major design changes
- Total Error Band (see Figure 1):
 - Provides a more comprehensive measurement of performance over the compensated temperature range, which minimizes testing and calibrating every sensor, thereby potentially reducing manufacturing cost; improves sensor accuracy and offers ease of sensor interchangeability due to minimal part-to-part variation.
 - Improves sensor accuracy
 - Offers ease of sensor interchangeability due to minimal part-to-part variation

POTENTIAL APPLICATIONS

- Medical: Ventilators/portable ventilators, CPAP, blood analysis, blood pressure monitoring, breast pumps, drug dosing, hospital beds, massage machines, oxygen concentrators, patient monitoring, sleep apnea equipment, urine analyzers and wound therapy
- Industrial: HVAC transmitters, life sciences, material handling, pneumatic control and regulation, process gas monitoring and valve positioning/ positioners
- Commercial: Air beds, coffee makers, washing machines, level measurement, dish washers, vacuum cleaners, hand dryers and rice cookers
- Transportation: Air brakes, CNG monitoring, fork lifts and fuel level measurement

FEATURES

- Total Error Band (see Figure 1): As low as ±1.5 %FSS
- Liquid media option: Compatible with a variety of liquid media
- Long-term stability: as low as ±0.2 %FSS
- Accuracy: ±0.25 %FSS BFSL
- Wide pressure range: ±6 mbar to ±12 bar | ±600 Pa to ±1.2 MPa | ±2 inH₂0 to ±175 psi
- · High burst pressures
- Wide operating temperature range of -40°C to 110°C [-40°F to 230°F]
- Calibrated over wide temperature range of -40°C to 110°C [-40°F to 230°F]
- 24-bit digital I²C or SPI-compatible output
- IoT (Internet of Things) ready interface
- Ultra-low power consumption (as low as 0.01 mW typ. average power, 1 Hz measurement frequency)
- Meets IPC/JEDEC J-STD-020E Moisture Sensitivity Level 1
- REACH and RoHS compliant
- Food grade compatible
- Temperature output available
- NSF-169, LFGB and BPA compliant materials

Honeywell offers a variety of board mount pressure sensors for use in potential medical and industrial applications. To view the entire product portfolio, click here.

TOTAL ERROR BAND

Total Error Band (TEB) is a single specification that includes the major sources of sensor error. TEB should not be confused with accuracy, which is actually a component of TEB. TEB is the worst error that the sensor could experience.

Honeywell uses the TEB specification in its datasheet because it is the most comprehensive measurement of a sensor's true accuracy. Honeywell also provides the accuracy specification in order to provide a common comparison with competitors' literature that does not use the TEB specification.

Many competitors do not use TEB—they simply specify the accuracy of their device. Their accuracy specification, however, may exclude certain parameters. On their datasheet, the errors are listed individually. When combined, the total error (or what would be TEB) could be significant.

0°C to 50°C	_	_	±1.5	%FSS ⁶
-20°C to 85°C	_	_	±3.0	%FSS ⁶
-40°C to 110°C	-	_	±4.5	%FSS ⁶
Accuracy ⁷	_	_	±0.25	%FSS BFSL
Resolution	14	_	_	bits
Temperature output error ⁸	_	±5	_	°C

¹Sensors are not reverse polarity protected. Incorrect application of supply voltage or ground to the wrong pin may cause electrical failure.

⁸ **Temperature Output Error:** The error in Temperature Output reading relative to a thermal reference standard over a temperature range of -40°C to 125°C.

TABLE 3. ENVIRONMENTAL SPECIFICATIONS					
CHARACTERISTIC	PARAMETER				
Humidity: all external surfaces internal surfaces of liquid media option "T and G" internal surfaces of dry gases option "N"	0 %RH to 95 %RH, non-condensing 0 %RH to 100 %RH, condensing 0 %RH to 95 %RH, non-condensing				
Vibration	15 g, 10 Hz to 2 kHz				
Shock	75 g, 6 ms duration				
Life ¹	1 million full scale pressure cycles minimum				
Solder reflow	J-STD-020-E Moisture Sensitivity Level 1 (unlimited shelf life when stored at \leq 30°C/85 %RH)				
Certification (silicone gel coating option, Port 1 only)	NSF169, BPA Free, LFGB				

¹Life may vary depending on specific application in which the sensor is utilized.

 $^{{}^2\}textbf{Operating temperature range:} The \ temperature \ range \ over \ which \ the \ sensor \ will \ produce \ an \ output \ proportional \ to \ pressure.$

³ Compensated temperature range: The temperature range over which the sensor will produce an output proportional to pressure within the specified performance limits (see Total Error Band).

⁴ **Startup time:** Based on 2.5 ms for power up to receive the first measurement command and average measurement time of 5 ms (data rate of 204 samples per second). Refer to Section 3.0, Tables 21, 22 and 25 for further details of communication timing.

⁵**Total Error Band:** The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range. Includes all errors due to offset, full scale span, pressure non-linearity, pressure hysteresis, repeatability, thermal effect on offset, thermal effect on span and thermal hysteresis.

⁶ Full Scale Span (FSS): The algebraic difference between the output signal measured at the maximum (Pmax.) and minimum (Pmin.) limits of the pressure range (see Figure 2).

⁷**Accuracy:** The maximum deviation in output from a Best Fit Straight Line (BFSL) fitted to the output measured over the pressure range at 25°C [77°F]. Includes all errors due to pressure non-linearity, pressure hysteresis and non-repeatability.

FIGURE 2. TRANSFER FUNCTION LIMITS

Pressure example 1: Transfer Function A (10% to 90%)

Output (% of
$$2^{24}$$
 counts) = $\frac{80\%}{P_{max} - P_{min}}$ x (Pressure_{applied} - P_{min}) + 10%

Pressure example 2: Transfer Function B (30% to 70%)

Output (% of
$$2^{24}$$
 counts) = $\frac{40\%}{P_{\text{max.}} - P_{\text{min.}}}$ x (Pressure_{applied} - $P_{\text{min.}}$) + 30%

POWER CONSUMPTION AND STANDBY MODE

The sensor is normally in Standby Mode and is only turned on in response to a user command, thus minimizing power consumption. Upon receiving the user command, the sensor wakes up from Standby Mode, runs a measurement in Active State, and automatically returns to Standby Mode, awaiting the next command. The resulting sensor power consumption is a function of the sampling rate (samples per second) as shown in Tables 7 and 8 and Figures 3 and 4.

TABLE 7. AVERAGE POWER CONSUMPTION AT 1.8 V _{SUPPLY} (ASSUMES COMMAND AA _{HEX})

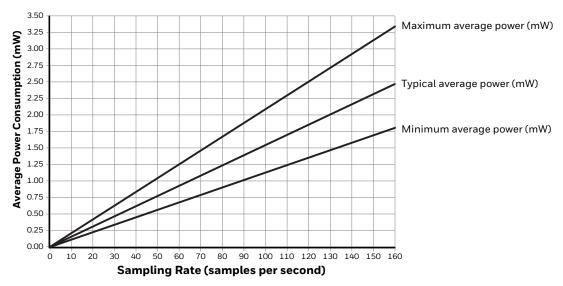

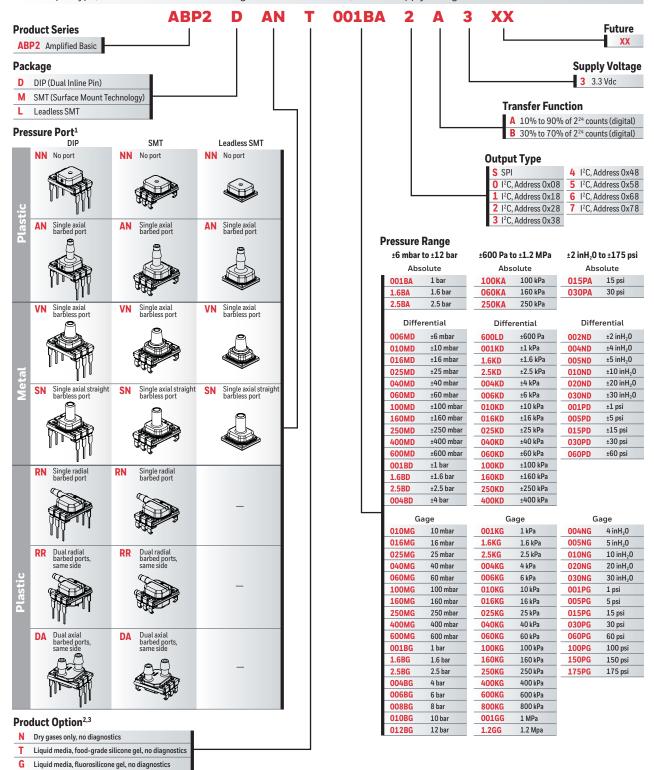

FIGURE 5. NOMENCLATURE AND ORDER GUIDE

For example, **ABP2DANT001BA2A3XX** defines an ABP2 Series Amplified Basic Pressure Sensor, DIP package, plastic single axial barbed pressure port, liquid media, food-grade silicone gel, no diagnostics, 1 bar absolute pressure range, digital l²C, address 0x28 output type, 10% to 90% of 2²⁴ counts (digital) transfer function, 3.3 Vdc supply voltage.

¹The "DA" Pressure Port is only available with Product Option "N" (dry gases, no diagnostics). The "DA" Pressure Port is available in standard listings with pressure ranges up to 250 mbar. For higher pressure ranges, please consult the factory.

 $^{^2}$ Product Option "N" is only available with gage pressure ranges 10 mbar to 40 mbar | 1kPa to 4 kPa | 4 inH $_2$ 0 to 20 inH $_2$ 0, \pm 6 mbar to \pm 25 mbar | \pm 1 kPa to \pm 2.5 kPa | \pm 2 inH $_2$ 0 to \pm 10 inH $_2$ 0.

³ Product Option "G" is available with 4 bar 160 psi gage and 1.6 bar 130 psi differential and above. See Tables 13, 15, and 17 for pressure range specifications when using fluorosilicone gel.

SELECT ABP2 SERIES SENSORS MOUNTED ON BREAKOUT BOARDS

Breakout boards, with or without the sensor premounted (see Figure 6 and Tables 9, 10, and 11) are designed for use with the Honeywell SEB Sensor Evaluation Kit.

FIGURE 6. APB2 SERIES SENSORS AND BREAKOUT BOARDS

SN Leadless SMT sensor premounted on breakout board (ABP2LSNT060PGSA3BB)

Breakout board (ABP2-BREAKOUT-BRD)

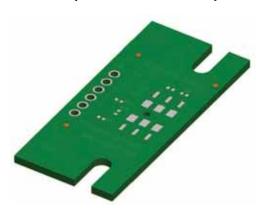

TABLE 9. ORDER GUIDE FOR ABP2 SERIES SENSORS AND BREAKOUT BOARDS					
CATALOG LISTING	DESCRIPTION				
ABP2MRRN004ND2B3BB	ABP2 Series sensor with SMT package, plastic dual radial barbed ports, same side pressure port, dry gases only, no diagnostics, ± 4 inH $_2$ O differential pressure range, I ² C address 0x28, 30% to 70% of 2 ²⁴ counts digital transfer function, 3.3 Vdc supply premounted on breakout board				
ABP2MDAN004ND2B3BB	ABP2 Series sensor with SMT package, plastic dual axial barbed ports same side, dry gases only, no diagnostics, ± 4 inH $_2$ O differential pressure range, I 2 C address 0x28, 30% to 70% of 2 24 counts digital transfer function, 3.3 Vdc supply premounted on breakout board				
ABP2MVNT400MG2A3BB	ABP2 Series sensor with leaded SMT package, metal single axial tapered pressure port, liquid media, food-grade silicone gel, no diagnostics, 400 mbar gage pressure range, I^2C address 0x28, 10% to 90% of 2^{24} counts digital transfer function, 3.3 Vdc supply premounted on breakout board				
ABP2LANT001PG2A3BB	ABP2 Series sensor with leadless SMT package, plastic single axial barbed pressure port, liquid media, food-grade silicone gel, no diagnostics, 1 psi gage pressure range, I^2C address 0x28, 10% to 90% of 2^{24} counts digital transfer function, 3.3 Vdc supply premounted on breakout board				
ABP2LSNT060PGSA3BB	ABP2 Series sensor with leadless SMT package, metal single axial straight barbless pressure port, liquid media, food-grade silicone gel, no diagnostics, 60 psi gage pressure range, SPI output type, 10% to 90% of 2^{24} counts digital transfer function, 3.3 Vdc supply premounted on breakout board				
ABP2LANT001BA2A3BB	ABP2 Series sensor with leadless SMT package, plastic single axial barbed pressure port, liquid media, food-grade silicone gel, no diagnostics, 1 bar absolute pressure range, I^2C address 0x28, 10%to 90% of 2^{24} counts digital transfer function, 3.3 Vdc supply premounted on breakout board				
ABP2-BREAKOUT-BRD	Bare breakout board for use with SMT and leadless SMT packages with AN, SN, VN, NN, RN, or RR pressure ports

Overpressi				1 . 1	6.1		1						

¹ Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure to higher pressures may cause permanent damage to the product. Unless otherwise specified, this applies to all available pressure ports at any temperature within the operating temperature range.

² **Burst Pressure:** The maximum pressure that may be applied to any port of the product without causing escape of pressure media. The product should not be expected to function after exposure to any pressure beyond the burst pressure.

³Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range without causing changes in specified performance.

 $^{^{1}}$ Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure to higher pressures may cause permanent damage to the product. Unless otherwise specified, this applies to all available pressure ports at any temperature within the operating temperature range.

² **Burst Pressure:** The maximum pressure that may be applied to any port of the product without causing escape of pressure media. The product should not be expected to function after exposure to any pressure beyond the burst pressure.

³ Common Mode Pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.

⁴Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range without causing changes in specified performance.

175PG	0	175	psi	240	_	375	_	_	±2.0	±3.0	±4.5	±1.0	±0.5	А

¹Overpressure: The maximum pressure which may safely be applied to the product for it to remain in specification once pressure is returned to the operating pressure range. Exposure to higher pressures may cause permanent damage to the product. Unless otherwise specified, this applies to all available pressure ports at any temperature within the operating temperature range.

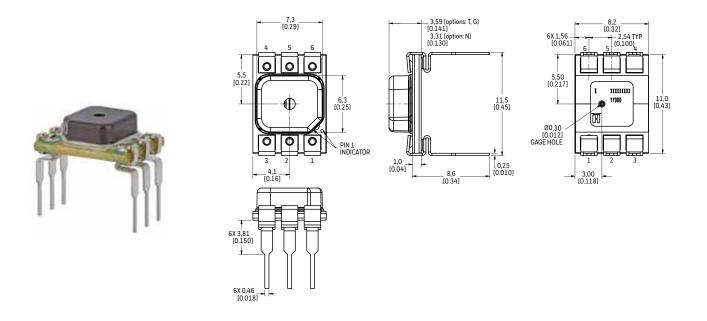

² Burst Pressure: The maximum pressure that may be applied to any port of the product without causing escape of pressure media. The product should not be expected to function after exposure to any pressure beyond the burst pressure.

³ Common Mode Pressure: The maximum pressure that can be applied simultaneously to both ports of a differential pressure sensor without causing changes in specified performance.

⁴Total Error Band: The maximum deviation from the ideal transfer function over the entire compensated temperature and pressure range without causing changes in specified performance.

FIGURE 11. I²C CIRCUIT DIAGRAM

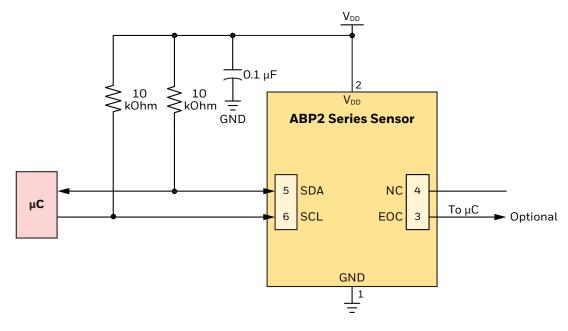

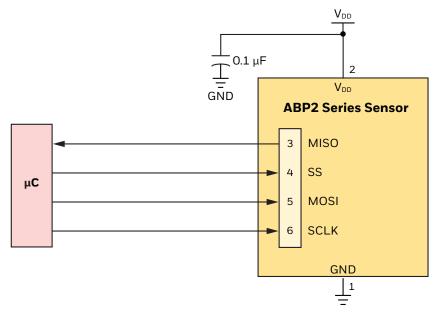

FIGURE 12. SPI CIRCUIT DIAGRAM

5.2 Bypass Capacitor Use

NOTICE

To ensure output noise suppression, place an external bypass capacitor of 0.1 μ F very close to the sensor power supply pin (see Figures 11 and 12) in the end-user design.

6.0 I²C COMMUNICATIONS

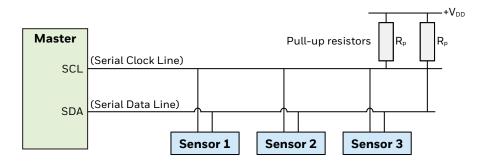

6.1 I²C Bus Configuration (See Figure 13.)

The I^2C bus is a simple, serial 8-bit oriented computer bus for efficient I^2C (Inter-IC) control. It provides good support for communication between different ICs across short circuit-board distances, such as interfacing microcontrollers with various low speed peripheral devices. For detailed specifications of the I^2C protocol, see Version 6 (April 2014) of the I^2C Bus Specification (source: NXP Semiconductor at https://www.nxp.com/docs/en/user-guide/UM10204.pdf).

Each device connected to the bus is software addressable by a unique address and a simple Master/Sensor relationship that exists at all times. The output stages of devices connected to the bus are designed around an open collector architecture. Because of this, pull-up resistors to $+V_{DD}$ must be provided on the bus. Both SDA and SCL are bidirectional lines, and it is important to system performance to match the capacitive loads on both lines. In addition, in accordance with the I^2C specification, the maximum allowable capacitance on either line is $400 \, \mathrm{pF}$ to ensure reliable edge transitions at $400 \, \mathrm{kHz}$ clock speeds.

When the bus is free, both lines are pulled up to $+V_{DD}$. Data on the I^2C bus can be transferred at a rate up to 100 kbit/s in the standard-mode, or up to 400 kbit/s in the fast-mode.

FIGURE 13. I²C BUS CONFIGURATION

6.2 I²C Data Transfer

The ABP2 Series I^2C sensors are designed to respond to requests from a Master device. Following the address and read bit from the Master, the ABP2 Series digital output pressure sensors are designed to output up to 7 bytes of data. The first data byte is the Status Byte (8 bit), the second to fourth bytes are the compensated pressure output (24 bit) and the fifth to seventh bytes are the compensated temperature output (24 bit).

6.3 I²C Sensor Address

Each ABP2 Series I²C sensor is referenced on the bus by a 7-bit Sensor address. The default address for the ABP2 Series is 40 (28 hex). Other available standard addresses are: 08 (08 hex), 24 (18 hex), 56 (38 hex), 72 (48 hex), 88 (58 hex), 104 (68 hex), 120 (78 hex). (Other custom values are available. Please contact Honeywell Customer Service with questions regarding custom Sensor addresses.)

6.4 I²C Pressure and Temperature Reading

To read out the compensated pressure and temperature reading, the Master generates a START condition and sends the Sensor address followed by a read bit (1). After the Sensor generates an acknowledge, it will transmit up to 7 bytes of data. The first data byte is the Status Byte (8-bit) and the second to fourth bytes are the compensated pressure output (24 bit) and the fifth to seventh bytes are the compensated temperature output (24 bit). The Master must acknowledge the receipt of each byte, and can terminate the communication by sending a Not Acknowledge (NACK) bit followed by a Stop bit after receiving the required bytes of data.

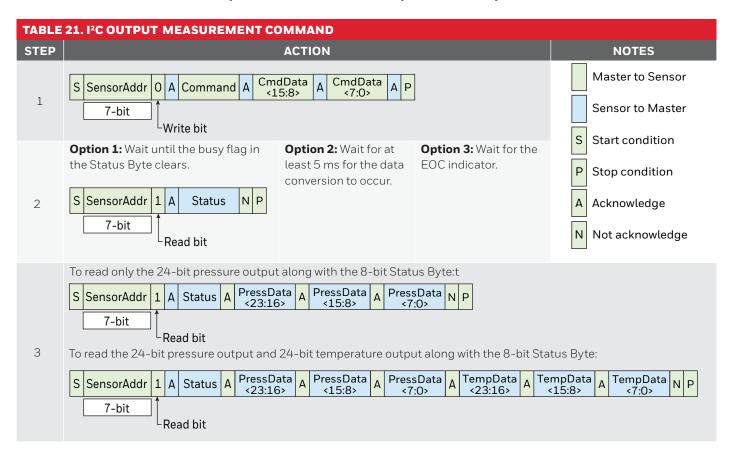

6.5 I²C Status Byte (See Table 20.)

TABLE 20. I ² C STATUS BYTE E	XPLANATION	
BIT (MEANING)	STATUS	COMMENT
7	always 0	-
6 (Power indication)	1 = device is powered 0 = device is not powered	_
5 (Busy flag)	1 = device is busy	Indicates that the data for the last command is not yet available. No new commands are processed if the device is busy.
4	always 0	_
3	always 0	_
2 (Memory integrity/error flag)	0 = integrity test passed 1 = integrity test failed	Indicates whether the checksum-based integrity check passed or failed; the memory error status bit is calculated only during the power-up sequence.
1	always 0	_
0 (Math saturation)	1 = internal math saturation has occurred	_

6.6 I²C Communications

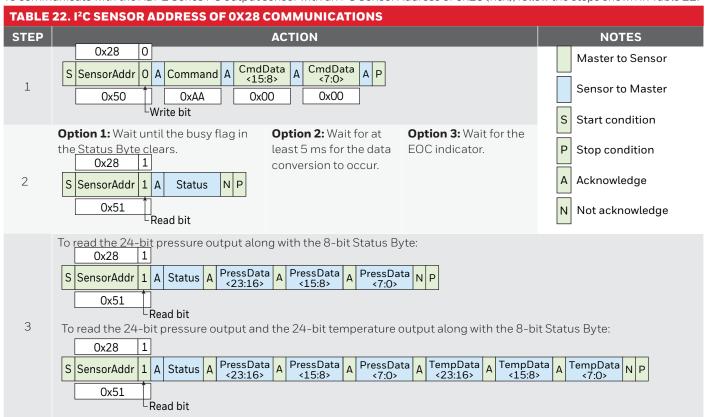

6.6.1 I²C Output Measurement Command

To communicate with the ABP2 Series I^2C output sensor using an Output Measurement Command of "0xAA", followed by "0x00" "0x00", follow the steps shown in Table 21. This command will cause the device to exit Standby Mode and enter Operating Mode. At the conclusion of the measurement cycle, the device will automatically re-enter Standby Mode.

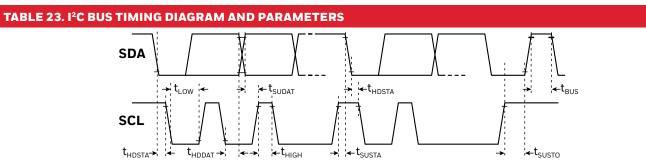

6.6.2 I²C Sensor Address of 0x28

To communicate with the ABP2 Series I²C output sensor with an I²C Sensor Address of 0x28 (hex), follow the steps shown in Table 22.

6.7 I²C Timing and Level Parameters (See Table 23.)

CHARACTERISTIC	ABBREVIATION	MIN.	TYP.	MAX.	UNIT
SCL clock frequency	f _{SCL}	100	_	400	kHz

          data[3],
          cBuff, percBuff, pBuff, tBuff);
  Serial.print(printBuffer);
  del ay(10);
```

7.0 **SPI COMMUNICATIONS**

7.1 **SPI Definition**

The Serial Peripheral Interface (SPI) is a simple bus system for synchronous serial communication between one Master and one or more Sensors. It operates either in full-duplex or half-duplex mode, allowing communication to occur in either both directions simultaneously, or in one direction only. The Master device initiates an information transfer on the bus and generates clock and control signals. Sensor devices are controlled by the Master through individual Sensors Select (SS) lines and are active only when selected. The ABP2 Series SPI sensors operate in full-duplex mode only, with data transfer from the Sensors to the Master. This data transmission uses four, unidirectional bus lines. The Master controls SCLK, MOSI and SS; the Sensor controls MISO. (See Figure 14.)

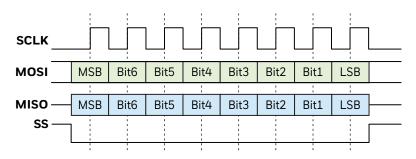

FIGURE 14. SPI BUS CONFIGURATION

7.2 **SPI Data Transfer**

Communicate with the ABP2 Series SPI sensors by de-asserting the Sensor Select (SS) line. At this point, the sensor is no longer idle, and will begin sending data once a clock is received. ABP2 Series SPI sensors are configured for SPI operation in mode 0 (clock polarity is 0 and clock phase is 0). (See Figure 15.)

FIGURE 15. EXAMPLE OF 1 BYTE SPI DATA TRANSFER

Once the clocking begins, the ABP2 Series SPI sensor is designed to output up to 7 bytes of data. The first data byte is the Status Byte (8-bit), the second to fourth bytes are the compensated pressure output (24-bit) and the fifth to seventh bytes are the compensated temperature output (24-bit).

7.3 **SPI Pressure and Temperature Reading**

To read out the compensated pressure and temperature reading, the Master generates the necessary clock signal after activating the sensor with the Sensor Select (SS) line. The sensor will transmit up to 7 bytes of data. The first data byte is the Status Byte (8-bit), the second to fourth bytes are the compensated pressure output (24-bit) and the fifth to seventh bytes are the compensated temperature output (24-bit). The Master can terminate the communication by stopping the clock and deactivating the SS line.

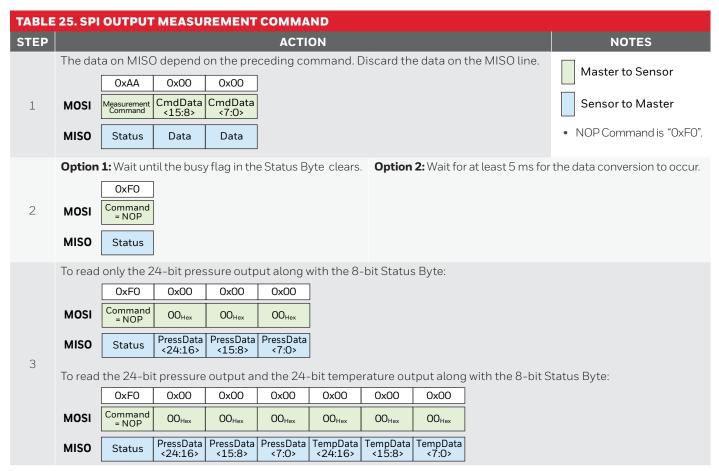

7.4 SPI Status Byte

The SPI status byte contains the bits shown in Table 24.

TABLE 24. SPI STATUS BYTE	EXPLANATION	
BIT (MEANING)	STATUS	COMMENT
7	always 0	_
6 (Power indication)	1 = device is powered 0 = device is not powered	_
5 (Busy flag)	1 = device is busy	Indicates that the data for the last command is not yet available. No new commands are processed if the device is busy.
4	always 0	_
3	always 0	_
2 (Memory integrity/error flag)	0 = integrity test passed 1 = integrity test failed	Indicates whether the checksum-based integrity check passed or failed; the memory error status bit is calculated only during the power-up sequence.
1	always 0	_
O (Math saturation)	1 = internal math saturation has occurred	_

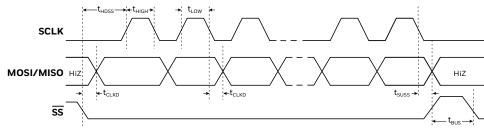

7.5 SPI Communication

To communicate with the ABP2 Series SPI output sensor using an Output Measurement Command of "0xAA", followed by "0x00" "0x00", follow the steps shown in Table 25. This command will cause the device to exit Standby Mode and enter Operating Mode. At the conclusion of the measurement cycle, the device will automatically re-enter Standby Mode.

7.6 SPI Timing and Level Parameters (See Table 26.)

TABLE 26. SPI BUS TIMING DIAGRAM AND PARAMETERS

CHARACTERISTIC	ABBREVIATION	MIN.	TYP.	MAX.	UNIT
SCLK clock frequency	f _{SCLK}	50	_	800	kHz
SS drop to first clock edge	t _{HDSS}	2.5	_	_	μs
Minimum SCLK clock low width ¹	t _{LOW}	0.6	_	_	μs
Minimum SCLK clock high width ¹	t _{HIGH}	0.6	_	_	μs
Clock edge to data transition	t _{CLKD}	0	_	_	μs
Rise of SS relative to last clock edge	t _{suss}	0.1	_	_	μs
Bus free time between rise and fall of SS	t _{BUS}	2	_	_	μs
Output level low	Out_{low}	_	0	0.2	V_{DD}
Output level high	Out _{high}	0.8	1	_	V_{DD}

 $^{^{1}}$ Combined low and high widths must equal or exceed minimum SCLK period.

```

8.0 **ABP2 SERIES CALCULATIONS**

8.1 **Pressure Output**

The ABP2 Series sensor pressure output may be expressed by the transfer function of the device as shown in Equation 1:

Equation 1: Pressure Sensor Transfer Function

$$Output = \frac{Output_{max.} - Output_{min.}}{P_{max.} - P_{min.}} * (Pressure - P_{min.}) + Output_{min.}$$

Rearranging this equation to solve for Pressure provides Equation 2:

Equation 2: Pressure Output Function

Pressure =
$$\frac{(Output - Output_{min.}) * (P_{max} - P_{min.})}{Output_{max} - Output_{min}} + P_{min.}$$

Where:

 $Output_{max.}$ = output at maximum pressure [counts]

Output_{min.} = output at minimum pressure [counts]

P_{max.} = maximum value of pressure range [bar, psi, kPa, etc.]

P_{min.} = minimum value of pressure range [bar, psi, kPa, etc.]

Pressure = pressure reading [bar, psi, kPa, etc.]

Output = digital pressure reading [counts]

Example: Calculate the pressure for a -1 psi to 1 psi gage sensor with a 10 to 90 calibration, and a pressure output of 14260634 (decimal) counts:

Output_{max.} = 15099494 counts (90 of 2^{24} counts or 0xE66666)

Output_{min.} = 1677722 counts (10 of 2^{24} counts or 0x19999A)

$$P_{\text{max.}} = 1 \text{ psi}$$

$$P_{min} = -1 psi$$

Pressure = calculated pressure in psi

Output = 14260634 counts

Pressure =
$$\left(\frac{(14260634 - 1677722)*(1 - (-1))}{15099494 - 1677722}\right) + (-1)$$

Pressure =
$$\left(\frac{25165824}{13421772}\right) + (-1)$$

Pressure = 0.875 psi

8.2 Temperature Output

The ABP2 Series sensor temperature output may be expressed by the transfer function of the device as shown in Equation 3:

Equation 3: Temperature Output Transfer Function

Temperature =
$$\frac{T_{out} * (T_{max.} - T_{min.})}{(2^{(24)} - 1)} + T_{min.}$$

Where:

Temperature = calculated temperature output in °C

T_{out} = digital temperature output in counts (decimal)

$$T_{\text{max.}} = 150^{\circ}\text{C}$$

$$T_{min.} = -50$$
°C

Example: Calculate the temperature for a temperature output of 6291456 (decimal) counts.

Temperature =
$$\frac{T_{out} * (150 - (-50))}{(2^{(24)} - 1)} + T_{min.}$$

Temperature =
$$\frac{6291456 * 200}{16777215} - 50$$

Temperature = 25°C

9.0 RECOMMENDED PNEUMATIC SENSOR CONNECTIONS

9 1 **Tubing**

Tubing is a common method of pneumatically connecting to the sensors and needs to be matched to the sensor's application to provide the required operating temperature range and working pressure. Depending on the working pressure range and operating temperature, the corresponding type of tubing can be selected (i.e., Superthane®, silicone, and vinyl). Silicone tubing, for instance, tends to be the easiest to which to connect; however, its working pressure is not as high as that of the other materials

The lower the shore rating for the tubing, the easier it is to insert the tubing onto the sensor's pressure port; however, the lower shore rated tubing also has lower working pressures. For working pressures of 20 psi and below, silicone or vinyl tubing tends to be used. For pressures above 20 psi, Superthane® or low-density polyethylene tubing may be considered. Table 27 shows recommended tubing for use with Honeywell's Basic Board Mount Pressure Sensors.

Generally, when the working pressure is 15 psi or less, clamps are typically not required. However, because each application is different, the end use must be taken into account before determining whether clamps are necessary to ensure that the tubing remains in place and doesn't leak. Considerations include vibration, pressure spikes, and the type of tubing being used. A common clamping method is to use a plastic cable tie, available in a variety of sizes and found in most hardware stores. They are relatively easy to install and stay in place over time.

NOTICE

Instead of using a clamp, a small drop of epoxy may be applied to either pressure port prior to the tubing being placed onto the port or applied at the end of the tubing once the tubing is in place. This method holds the tubing in place and can further act as a sealing agent to help ensure a leak-tight connection between the pressure port and the tubing. A room temperature sealant is generally used for this purpose. Ensure that the epoxy doesn't block the hole in the port as it needs to remain open.

NOTICE

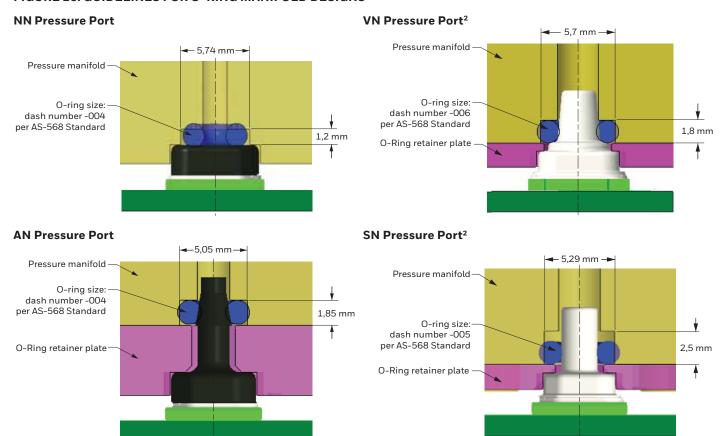

To apply a more rigid tubing-to-port connection, a low-power heat gun may be used to slightly heat the tubing. Once cooled, the tubing tends to grip the pressure port better.

TABLE 27. RECOMMENDED TUBING

9.2 O-ring Manifold Designs

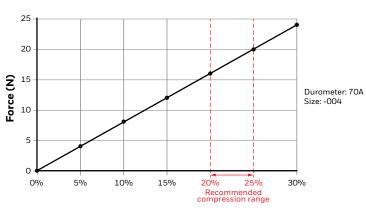

O-rings may also be used to connect pneumatically to the sensor. Most O-ring manufacturers recommend a compression of 20% to 25% to provide the proper O-ring compression over the temperature range. Silicone or fluorosilicone O-rings are commonly used as they tend to take less of a set over temperature verses other O-ring materials. System operating temperatures and sealant media compatibility are the two most important parameters which must be considered when selecting an O-ring base polymer. See Figures, 16, 17 and Table 28 for more information.

FIGURE 16. GUIDELINES FOR O-RING MANIFOLD DESIGNS¹

¹The recommended design has been validated for operating conditions ranging from -40°C to 110°C and up to 16 bar gage pressure.

% of O-ring Compression

NOTICE

It is the buyer's sole responsibility to determine the suitability of the product in the application.

 $^{^2}$ For more demanding applications, a second O-ring can be used with a gland height of 3,6 mm (VN pressure port) and 4,55 mm (SN pressure port).

9.2 O-ring Manifold Designs (continued)

TABLE 28. RECOMMENDED O-RINGS								
PRESSURE PORT	O-RING SIZE AS-568 UNIFORM DASH NUMBERS	O-RING ID (MM)	O-RING C/S (MM)	MATERIAL	SUPPLIER	PART NUMBER	SHORE HARDNESS	
NN	-004	1,78	1,78	fluoroelastomer	McMaster	8333T114	durometer 70A

WARRANTY/REMEDY

Honeywell warrants goods of its manufacture as being free of defective materials and faulty workmanship during the applicable warranty period. Honeywell's standard product warranty applies unless agreed to otherwise by Honeywell in writing; please refer to your order acknowledgment or consult your local sales office for specific warranty details. If warranted goods are returned to Honeywell during the period of coverage, Honeywell will repair or replace, at its option, without charge those items that Honeywell, in its sole discretion, finds defective.

The foregoing is buyer's sole remedy and is in lieu of all other warranties, expressed or implied, including those of merchantability and fitness for a particular purpose. In no event shall Honeywell be liable for consequential, special, or indirect damages.

△ WARNINGPERSONAL INJURY

DO NOT USE these products as safety or emergency stop devices or in any other application where failure of the product could result in personal injury.

Failure to comply with these instructions could result in death or serious injury.

⚠ WARNINGMISUSE OF DOCUMENTATION

- The information presented in this product sheet is for reference only. Do not use this document as a product installation guide.
- Complete installation, operation, and maintenance information is provided in the instructions supplied with each product.

Failure to comply with these instructions could result in death or serious injury.

While Honeywell may provide application assistance personally, through our literature and the Honeywell web site, it is buyer's sole responsibility to determine the suitability of the product in the application.

Specifications may change without notice. The information we supply is believed to be accurate and reliable as of this writing. However, Honeywell assumes no responsibility for its use.
